### **About The Tutorial**

A function pointer, also called a subroutine pointer or procedure pointer, is a pointer that points to a function. As opposed to referencing a data value, a function pointer points to executable code within memory. Dereferencing the function pointer yields the referenced function, which can be invoked and passed arguments just as in a normal function call.

3.1 Introduction to the Concept of Callback Functions. Function Pointers provide the concept of callback functions. If you are not sure of how to use function pointers take a look at the Introduction to Function Pointers. I'll try to introduce the concept of callback functions using the well known sort function qsort. This function sorts the items of a field according to a user-specific ranking.

While this is a good introduction to pointers, it doesn't mention the best feature of using pointers: arithmetic. If you declare an array of type int, what you are really doing is creating a pointer to a location in memory that consists of a sequence of 4 byte blocks (because int's are typically 4 bytes to most compilers).
