The relays covered by this guide are listed in Table 1 and are all designed to operate at normal rated voltage to detect reverse power or overpower conditions on a power system. All of these relays with the exception of the ICW51B are suitable for application on three-phase systems only.

This is where system protection, and protective relays become important. If component failure is inevitable, then it is necessary to provide a means of detecting these failures. Better and faster protection afford a number of desirable attributes, all of which ultimately result in saving the owner of the system money through cost avoidance.

In electrical engineering, a protective relay is a relay device designed to trip a circuit breaker when a fault is detected. [1] : 4 The first protective relays were electromagnetic devices, relying on coils operating on moving parts to provide detection of abnormal operating conditions such as over-current, over-voltage, reverse power flow, over-frequency, and under-frequency.

Basic Objectives Of System Protection. The fundamental objective of system protection is to provide isolation of a problem area in the power system quickly, so that the shock to the rest of the system is minimized and as much as possible is left intact. Within this context, there are five basic facets of protective relay application.
