In the United States, marine aquaculture operates within one of the most comprehensive regulatory environments in the world. Projects that are sited in U.S. waters must meet a number of federal, state, and local regulations that ensure environmental protection, water quality, and healthy oceans.

The biological and geological future of Earth can be extrapolated based upon the estimated effects of several long-term influences. These include the chemistry at Earth's surface, the rate of cooling of the planet's interior, the gravitational interactions with other objects in the Solar System, and a steady increase in the Sun's luminosity. An uncertain factor in this extrapolation is the ...

Healthy marine species like whales, sea turtles, coral, and salmon are important for maintaining balanced and thriving ocean ecosystems. We work to prevent marine species populations from decline and extinction, protect them from human activities, and monitor activities that might impact them so they are around for future generations.

The increase in atmospheric carbon dioxide has, however, had a substantial environmental effect. Atmospheric CO₂ fertilizes plants. Higher CO₂ enables plants to grow faster and ...

At the College of Earth, Ocean, and Atmospheric Sciences, the landscape is our laboratory. Our explorations extend from local to global, from the core of the Earth through the seas and all the way to Mars, and from science to policy and practice.

Atmospheric pressure at a particular location is the force per unit area perpendicular to a surface determined by the weight of the vertical column of atmosphere above that location. On Earth, units of air pressure are based on the internationally recognized standard atmosphere (atm), which is defined as 101.325 kPa (760 Torr or 14.696 psi). It is measured with a barometer.

As a Colorado State University Ph.D. student in atmospheric science, Alexandra Naegele spends most of her days in front of a computer, using models to study clouds, precipitation and atmospheric energy.
